Dear All,

I like to inform you, that the local group at Frankfurt that invested in a device to measure ultra fine particles was successful.

They could show in details, that each plane (!) raises the values in the area of landings and starting. Great figures and a real verification.

Impact of Frankfurt Airport at the area is **1 Mio liter kerosene burnt at FRA per day!**

In consequence, the UBA, that is the national environmental agency of the German government, invests into a research about "Impact of aviation at one hub airport in Germany"

This research started Oct 1<sup>st</sup> in Frankfurt area.

Company Lohmeyer got the job and money to work this out.

We have a certain influence to insist and control this study.

If you are interested, we may put this topic on the next agenda and meeting or have upfront a phone meeting to this subject.

Best regards

Martin
